

Education

Everything we do and everything we touch is connected to water. The food we eat, the clothes we wear, and the electricity to light our houses were all

created using large amounts of water.

Water and education are closely inter-related. Although education is not vital for our existence as water is, it is of great importance. We need education for our society to prosper, to better understand each other and the world, for our personal development and for many other reasons.

The intimate relationship between water and education is based on the need for information: We need to be educated about water in order to know how to deal with all kinds of water-related problems. Communities need to know how to best manage their water systems. Education and information is the first step to solutions and more generally to make us aware of the need for improved water management.

Sustainable water management is crucial to secure social and economic permanency, as well as a healthy environment. This is achievable only as a result of cooperation and a commitment to education.
