

Data Collection and Management

This activity is at the center of all decision making and planning that the water provider/entity conducts. Data should be collected and stored in such a manner that it is safeguarded from damage or loss, is accessible for inspection and evaluation, and can be readily utilized to characterize trends and support management efforts.

Data collection related to water production and treatment should focus upon:

- Master metering of raw water and treated water
- Tracking of unmetered water uses
- Tracking of treatment and production costs
- Mapping of treatment and production facility infrastructure
